Please try and make corrections where necessary. Added Kelvins Python part and my nodejs part. Added a bit to intro and the proof of concepts findings table all in purple. Sorted the formatting so just needs to be proof read now thanks guy 😊 please notify when you agree to send the document.

Something I've just remembered is that we've failed to mention Martin's email and include his use of the language Erlang for a functional approach but if someone has something to say please add it to the intro with the reason we wont be using it.

Sorry for the late one I mustve picked up a virus on my USB or something coz i saved my work on it and kept bugging out every PC i used so it was hard to finish my part. sorry for the late one

Added more references because some statements are made with no source. But Rationale I just added one more line in the end about how easy it is to change from our currently used XML to JSON. proof reading done. You may check again if you can. I just quickly read but didnt compare to Annes annotated version.

I was wondering what to do with the information we received about DownStage in Martin's email. It is very detailed but there are lots of new concepts in it that make it kind of hard to explain unless that was researched or just documented better for the investigation. What do you guys think?

The updated diagram. Inputs come from the user through the user interface. The controller catch the inputs and dispatches them as event to the models. Model will catch events they are interested in and update data, then it will broadcast to all registered views. Eventually the view update the UI.

Hi, guys. I think it's better to remove the plain text file from the storage candidate list. It's not secure at all and it is just not suitable for storing data of a web application. The research evidence is really poor as well. Siatua Uili, so I don't think you need to research on this, but just mention that we don't want to think this as a candidate in the introduction, thanks!

I think we need to discuss what to choose for the data storage again as we have two more candidates for the data storage, so tomorrow we might send the documents about architectures and languages to Anne and we discuss about the data storage after the meeting with Anne (or together with Anne). Everyone agrees?

EVENT DRIVEN DIAGRAM

So each event generator will send its events to the dispatcher, which will then send it to all applicable event receivers. Each receiver then checks if the event was meant for them, and if it is not, throws it away. Otherwise, it handles the event (each handler may handle it differently).

9 September · Auckland · Edited

Event-driven architecture itself means the reaction or response to events. For example, if you click a button, something pops up. Simply, that is an event-driven. It is usually used with publish-subscribe pattern, which is the one that William talked about yesterday, and event-driven is kind of driven from it. If something happens in the client side, the message will be delivered to all services.

You can use both microservices and publish-subscribe patterns for one system, bu... See More

Software Architecture: Monolithic Applications

(Single tier application eg. MVC) A software system is called "monolithic" if it has a **monolithic architecture**, in which functionally distinguishable aspects (for example data input and output, data processing, error handling, and the user interface), are not architecturally separate components but are all interwoven. (https://en.wikipedia.org/wiki/Monolithic_software_architecture)

 **Alyssa Byun**
26 August

I told Paul that we had a meeting and it was quite difficult for us to find out what kinds of services the UpStage has, because none of us has experienced with this pattern.

He said that it is difficult to do properly but what we need to remember is that the whole point of an iterative approach is to improve over time, so we could start with a chat service, a media service (he recommended to split this into an audio service and a visual service), and authentication service fo... - Backlogs are in tables now in order to add another column identifying if it is "MUST HAVE" or "NICE TO HAVE". We will need to identify them together on Thursday at the team meeting.
- Added team contract as an appendix. If any of you want to edit or add, please do so.
- Added page number on each page
- Still need to change the schedule (working days to hours, total hours must be same as the hours stated in student costs section)

UpStage Functionality List. (Requirements)

UpStage Functionality as in semester 2 2014 proposal

Audience

- Can access a link to find user's local time in the homepage
- Can enter a stage
- Can send text messages in the stage
- Can register to be a Player
- Sign in with the registered account

Player

- Has the same functionalities as audience
- Can log out
- Will have tool bar in the stage if the player is assigned to this stage
- Can put avatars in the stage
- Can move the avatars in the stage
- Can stop the avatars in the stage
- Can select a prop at the bottom right side of the window
- Can select a background at the bottom left side of the window
- Can clear the avatars in the stage
- Can play audio in the stage
- Can turn volume up/down for audio in the stage

UpStage Requirements

UpStage server is up upstage.aut.ac.nz:8085

You will need to access it from a computer with flash and probably an older version of a web browser. Also probably only accessible from inside AUT.

Hey guys, Anne has replied and asked to meet 2.30pm on Tuesday next week. Here's what she said:

Thank you for the email and the availability list. I have booked an appointment to meet on next Tuesday 2.30pm. I will meet you all in the foyer at this time.

Also I think it would be wiser to use the Upstage team email address for communication so that it is somewhere that everyone can access it....
